Folder Profiler — setup on Windows

Using **run-ui.bat** · Windows 10 / 11 (64-bit) · version 1.7 · nothing to install

You need: a Windows 10 or 11 computer (64-bit) and a web browser. Python is already inside the package, so you do **not** install Python or Docker. The tool only **reads** your files, never changes or uploads them, and the page runs only on that computer.

One-time setup

1. **Get the package.** Download `folder-profiler-ui.zip` from the link you were sent.
2. **Extract it.** Right-click the zip → **Extract All…** → choose a short location such as `C:\Profiler` → **Extract**. *Do not run anything from inside the zip window — it must be extracted first.*
3. **Check the folder.** Open the extracted `folder-profiler-ui` folder. It should contain `run-ui.bat`, `file_profiler.py` and a folder called `python`. If `python` is missing, extract the whole zip again.

Every time you run it

1. **Double-click `run-ui.bat`.** If Windows shows a blue *"Windows protected your PC"* screen, click **More info**, then **Run anyway**. (The file is plain text; you can open it in Notepad to read it.)
2. **The page opens.** A black window appears and your browser opens the Folder Profiler page. If the browser does not open, copy the address shown in the black window into the browser. **Keep the black window open** the whole time.
3. **Choose the folder to measure.** Use *One parent folder* if its sub-folders are the projects, or *Pick project folders* to tick them one by one. You can paste a path such as `Z:\Project1` or `\\server\share\Project1` into the box and press Enter.
4. **Step 1: quick count.** Click *Step 1: quick count*. It takes seconds to a few minutes and shows a table of the most common file types. Click *Download quick count zip*.
5. **Step 2: full profile.** Click *Step 2: full profile*. Large folders can take hours because every file has to be opened to read its type. Leave both windows open until the page says **Done**, then click *Download metrics zip*.
6. **Send us the zip file(s).** They are also saved in the `output` folder inside `folder-profiler-ui`.

Good to know

If it stops	Crash, power cut or restart during step 2: run `run-ui.bat` again and choose the **same folder**. It continues from where it stopped, and files that changed in between are redone. Tick *"Start from scratch"* only if you

	want to ignore the saved progress. Step 1 is quick enough to simply run again.
Privacy	The step 2 zip contains your **file and folder names** and the names of files that assemblies refer to — send it only if you are happy to share those. The step 1 zip contains only the project folder names and the file types and counts. Compressed files (.zip, .rar, .7z) are counted as one file each; nothing is opened inside them.
Depth	Both steps read every sub-folder, however deeply nested.
Closing	When you are finished, close the browser tab and then the black window.

If something goes wrong

You see	Do this
“Python was not found”, or nothing happens	The `python` folder is missing. Extract the *whole* zip again (Extract All) and run `run-ui.bat` from the extracted folder.
The browser does not open	Copy the address printed in the black window (it starts with `http://127.0.0.1:`) into your browser.
“Not a folder”	Choose the folder again, or paste its full path and press Enter.
“The run stopped” / “Something went wrong”	Click the step button again (it resumes). If it keeps failing, send us `output\error_log.txt` ; your name and folder paths are removed from it automatically.
Antivirus blocks `run-ui.bat` or the `python` folder	Allow it, or tell us — the Python inside is the official Windows build from python.org.
Another run is already in progress	Wait for it to finish, or close the black window and start `run-ui.bat` again.

Everything the tool does is in `file_profiler.py` (plain text, open in Notepad). Questions: reply to the person who sent you this package.
