Folder Profiler

How to run it · Windows 10 / 11 (64-bit) · version 1.7 · two steps: a quick count, then the full profile

What this does. It measures the files in a folder and its sub-folders, at any depth. **Step 1** (quick count) only counts how many files of each type there are and how big they are — very fast, no file is opened. **Step 2** (full profile) records, for every file, its type, size, date, a short format tag, its **file name and folder path**, the **names of the files that assemblies, drawings and STEP files refer to**, and the number of **sheets (layouts)** of AutoCAD drawings. It **never copies, uploads or saves your files** and never stores file contents. It does not use the internet. Each step gives you **one small zip file** to send to us.

The step-2 zip contains your file and folder names. Send it only if you are happy to share those. The step-1 zip contains only the project folder names and the file types and counts. Compressed files (.zip, .rar, .7z, .tar …) are counted as one file each — nothing is opened inside them.

Steps

1. **Unzip the package.** Right-click `folder-profiler-ui.zip` → **Extract All…** into a short location such as `C:\Profiler`. *Do not run it from inside the zip window.*
2. **Start it.** Double-click `run-ui.bat` (nothing to install; Python is included). A browser page opens (if it does not, use the address shown in the black window). If Windows shows a blue "Windows protected your PC" screen, click **More info**, then **Run anyway** — the file is plain text you can open in Notepad.
3. **Choose the folder** to measure (one parent folder whose sub-folders are the projects, or pick project folders one by one).
4. **Click *Step 1: quick count*** (optional but recommended first). It finishes in seconds to a few minutes and shows a small table of the most common file types. Click *Download quick count zip*.
5. **Click *Step 2: full profile*.** Large folders take a long time because every file has to be opened to read its type. Leave the window open until it says **Done**, then click *Download metrics zip*. (The zip is also saved in the `output` folder.)
6. **Send us the zip file(s).** Email or upload them.

Other ways to start it

Without the browser page	With Docker (most locked-down)
Drag the folder onto `run.bat` for step 2. For step 1, open a command prompt in the folder and run `run.bat "D:\path\to\folder" --quick`.	Needs **Docker Desktop** running. Drag the folder onto `run-docker.bat` (step 2) or add `--quick` for step 1. The tool runs in a sealed box: your folder is mounted **read-only**, the box has **no**

	internet. First run needs internet once (about 1 minute).

If it stops, and what to send us

If step 2 stops	Crash, power cut, restart, Ctrl+C — start it again with the **same folder**. It continues from the last saved point; files that changed in between are noticed and redone (progress is kept in a hidden `.resume` folder inside `output` and removed when the run finishes). Tick *"Start from scratch"* to ignore it. Step 1 is quick enough to simply run again.
Run statistics	Step 2 also makes `run_stats_….zip` (and a *"Download run statistics"* button): how long each step took, and your computer's CPU, memory and reading speed. No file names, folder names, computer name or user name. Send it along if we ask how your machine performed.
Nothing is hashed	The tool never computes fingerprints of your files and never reads a file in full, except the assembly, drawing and STEP files whose references are listed and the AutoCAD drawings whose sheets are counted. Folders are read at any depth.

Check it before you send (optional)

- Open the zip. Open any file inside in Excel or Notepad. Step 1 holds `Extensions.csv`, `Extensions_All.csv`, `Projects.csv` and `Run_info.csv`. Step 2 holds `Files.csv`, `Dirs.csv`, `Links.csv`, `Projects.csv`, `Extensions.csv`, `Run_info.csv` and run statistics.
- Step 2 shows file names, folder names and paths, extensions, sizes, dates, format tags and the names of referenced files — never file text or geometry.

What is in each file (step 2)

File	Contents
Files.csv	One row per file: project, number, extension, size, modified date, depth, format tag (e.g. STEP, PDF), folder id, assembly file name, path, and for AutoCAD drawings the number of sheets and a confidence number
Links.csv	For assembly, drawing and STEP files: the names of the files they refer to
Dirs.csv	The folder tree
Projects.csv	One row per project folder: file count, total size, date range
Extensions.csv	File count and size for each extension, per project
Run_info.csv	Tool version, date, Windows version, how it was run, totals, any unreadable files, and how long each step took

If something goes wrong

You see	Do this
“Python was not found”	You are missing the `python` folder. Extract the *whole* zip again (Extract All) and run from the extracted folder.
“Docker Desktop was not found”	Install Docker Desktop, or use `run-ui.bat` instead.
“Not a folder”	Choose the folder again, or paste its full path and press Enter.
“Something went wrong”	Send us `output\error_log.txt`. Your name and folder paths are removed from it automatically.
Antivirus blocks `run-ui.bat` or the `python` folder	Allow it, or tell us — the Python inside is the official Windows build from python.org.

Everything the tool does is in `file_profiler.py` (plain text, open in Notepad). Questions: reply to the person who sent you this package.
